

With particularly low resistance

Thermostatic Radiator Valves

Without presetting

With particularly low resistance

The thermostatic valve bodies with particularly low resistance are used e. g. in two-pipe low temperature heating systems with a small temperature spread and conventional single pipe heating systems.

Key features

- > **Double O-ring seal**
for durable and maintenance free operation
- > **Thermostatic insert replaceable under pressure**
with DN 10 and DN 15
- > **Valve body in gunmetal**
corrosion-resistant and safe

Technical description

Applications area:

Heating and cooling systems.

Function:

Control
Shut-off

Dimensions:

DN 10-32

Pressure class:

PN 10

Temperature:

Max. working temperature: 120°C,
with protection cap or actuator 100°C.
Min. working temperature: -10°C.

Materials:

Valve body: corrosion resistant Gunmetal
O-rings: EPDM rubber
Valve disc: EPDM rubber
Return spring: Stainless steel
Valve insert: Brass
The complete thermostatic insert can be replaced using the fitting tool without draining the system (DN 10, DN 15).
Spindle: Niro-steel spindle with double O-ring sealing. The outer O-ring can be replaced under pressure.

Surface treatment:

Valve body and fittings are nickel-plated.

Marking:

THE, country code, flow direction arrow, DN and KEYMARK-Designation.
Blue protection cap.
Blue stuffing box for DN 10, DN 15 angle and straight.
II+ Designation for DN 10, DN 15 axial, double angle and straight with bended nipple.

Pipe connection:

The female-threaded version is designed for connection to threaded pipe, or in conjunction with compression fittings, to copper precision steel or multi-layer pipe (only DN 15).
The male-threaded version, in conjunction with the appropriate compression fittings, permits connection to plastic pipe.

Connection to thermostatic head and actuator:

HEIMEIER M30x1.5

Construction

1. Valve seat dimension designed for large massflows
2. Valve body made of corrosion-resistant nickel-plated gunmetal

Application

The thermostatic valve bodies with particularly low resistance are used e. g. in two-pipe low temperature heating systems with a small temperature spread and conventional single pipe heating systems.

Corresponding to the standards EnEV and DIN V 4701-10, the valve bodies can be designed with a control difference from 1 K to 2 K thus enabling a broad flow spectrum.

A hydraulic balance, which is an additional requirement for two-pipe heating systems, can be reached with the appropriate lockshields, e. g. Regulux.

Noise behaviour

To ensure low-noise performance, the following conditions must be met:

- On the basis of experience, the differential pressure over the thermostatic valves should not exceed about 20 kPa = 200 mbar = 0.2 bar. If in designing the system, higher transient differentials might be experienced in the part-load flow range, differential pressure control equipment such as a STAP Differential Pressure Controller or Hydrolux bypass valves can be used.
- Mass-flow must be correctly adjusted.
- The system must be completely deaerated.

Sample application

Single pipe heating system

1. Thermostatic valve body with particularly low resistance
2. Lockshield
3. STAD balancing valve

Notes

– To avoid damage and the formation of scale deposit in the hot-water heating system, the composition of the heat transfer medium should be in accordance with the VDI guideline 2035. For industrial and long-distance energy systems, see the applicable codes VdTÜV and 1466/AGFW FW 510. A heat transfer medium containing mineral oils, or any type of lubricant containing mineral oil can have extremely negative effects and usually lead to the disintegration of EPDM seals. When using nitrite-free frost and corrosion resistance solutions with an ethylene glycol base, pay close attention to the details outlined in the manufacturers' documentation, particularly concerning concentration and specific additives. Flush the system before changing thermostatic valves in heavy polluted existing systems.

– The thermostatic valve bodies can be used with all HEIMEIER thermostatic heads and HEIMEIER or TA thermal or motorized actuators. The optimal tuning of the components guarantees maximum safety. When using actuators from other manufacturers, make sure that the pressure power is appropriate for thermostatic valve bodies with soft sealing valve discs.

$$Cv = \frac{Kv}{0,86}$$

$$Kv = Cv \cdot 0,86$$

Sample calculation 1

Target:

Pressure loss, thermostatic valve body with particularly low resistance DN 15 angle, straight with p-band 2 K

Given:

Heat flow Q = 2210 W

Temperature spread Δt = 10 K (55/45 °C)

Solution:

Mass flow $m = Q / (c \cdot \Delta t) = 2210 / (1,163 \cdot 10) = 190 \text{ kg/h}$

Pressure loss from diagram $\Delta p_v = 44 \text{ mbar}$

Sample calculation 2

Target:

Appropriate thermostatic valve body with particularly low resistance

Given:

Heat flow Q = 8375 W

Temperature spread Δt = 15 K (70/55 °C)

Pressure loss, thermostatic valve $\Delta p_v = 95 \text{ mbar}$

Solution:

Mass flow $m = Q / (c \cdot \Delta t) = 8375 / (1,163 \cdot 15) = 480 \text{ kg/h}$

Thermostatic valve body with particularly low resistance from diagram: DN 32 (1 1/4")
